## ***Individual Differences in Imagery, Emotion, and Memory***

**Venerdì 12 Giugno 2015 – ore 17**

Aula De Sarlo  
Via di San Salvi 12, Padiglione 26

## Abstract

This talk will present the research investigating individual differences in mental visualization in relation to emotion and memory. In particular, it will focus on individual differences in object imagery (mental visualization of pictorial appearances of objects in terms of shape, colour, and texture) and spatial imagery (mental visualization of locations, spatial relations, and transformations). This talk will present the data demonstrating the relationship between measures of individual differences in object imagery, spatial imagery, and different measures of emotional processing. Furthermore, it will focus on memory errors in tasks that require imagining and memorizing facial emotions. The talk will include developmental and eye-tracking research. The discussion will be devoted to the relationship between imagery, emotion, and memory processing.
